

Holtorff - Windhundrennmaschinen

Operating instructions of Mistral 500 (700)

Contents

- motors, rope guide, electronic control, brake
- 500(700)m line with 1mm diameter (60 kg braking resistance)
- 10m line with 1mm diameter (16 kg braking resistance), serves as security line
- 1 jumper cables red/black is installed
- 1 lever is installed
- 5 rolls and 15 fixing nails
- 1 rubber mallet

Please read the operating instructions carefully before applying the machine to avoid injuries to yourself, other people, dogs or damages to the machine.

How to lay out the “rabbit”

1. Put the case in front or next to your car, take the rolls, the rubber mallet, the nails, the cable and the “rabbit”.

Put the line through the special eye of the rope guide and through the window of the case. Attach the hunting object (rabbit skin or similar things) with max. weight 200g at the end of the thin line.

2. **The course**

Go straight ahead 100m with the hunting object, the rubber mallet, the nails and the rolls and attach the 1st roll with 3 nails to the meadow and place the line on the one side of the roll.

Repeat the action of a. with the next rolls and complete the course nearby your car.

Attention: No crossing of the line, the angle of the line shall not be under 60° to avoid a crossing of the running line.

To activate the brake unlock the handle (draw near the handle lightly and let it go).

3. **Start of the race:**

Connect the jumper cables with the 12 volt battery of your car.

Attention: Connect the red cable (+) with the positive pole (+), and black cable with the negative pole of the battery. A wrong poling causes damage to the machine and the line.

Please see to it that nobody touches the hunting object or the line and that nobody stands in the immediate vicinity.

By pulling the lever to the pipe, the machine gets activated. When the hunting object is about 30m away you can set the dogs free.

4. Speed adjustment

To regulate the velocity pull the lever or open it lightly. By opening the lever completely the “rabbit” will be stopped. By pulling the lever it will start again.

5. Ending the race:

When the hunting object is only 20m away from the machine, release the lever to end the race. The “rabbit” will be stopped and the dogs can catch it.

Attention: don't start the machine again as long as the dogs are straining at the “rabbit” or are in reach of the line (serious danger of injury). Capture the dogs and bring them to a secure place.

6. Rolling up the rest of the line

Pull the “rabbit” as described in 7. only a few meters away from the machine.

Attention: Happens very fast. Stay away from the line or the “rabbit”. Keep an eye on other people standing around.

Don't pull the hunting object into the machine, but, for the last three meters, turn the cylinder by hand with the lever in the middle position until the “rabbit” is near the machine.

Security information: To avoid the accidental or unauthorized use of the machine while laying out the line, see to it that the machine is not linked-up with the battery.

For economical use of the battery it is recommendable to let the motor run during the cursing.
